# Social identity, norms & engineering: A political economy perspective

Nation-building

Group socialization

Behavioral modification

Social norm change

Research frontiers

# Most homogenous nations did not begin homogenous

e.g. Extreme linguistic differences in early modern France

*Being French was not a source of personal pride, let alone the basis of a common identity. Before the mid-nineteenth century, few people had seen a map of France and few had heard of Charlemagne and Joan of Arc. France was effectively a land of foreigners.*

— Graham Robb (2008)  
“The discovery of France”

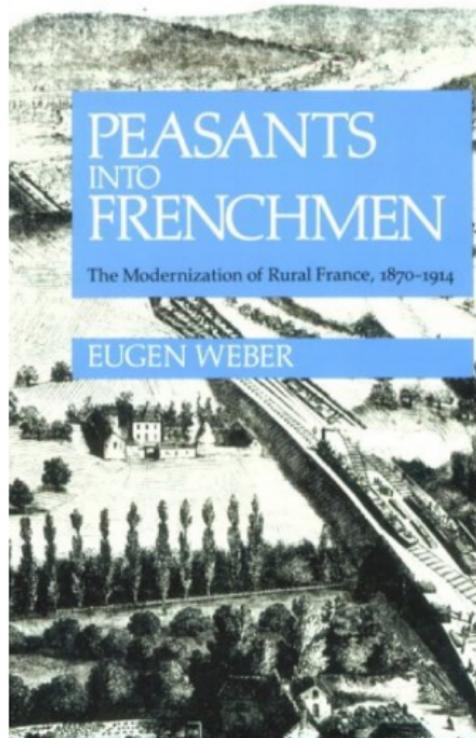

Figure: France in 1477

# State & nation building a gradual process of projecting power into periphery and people, reshaping society

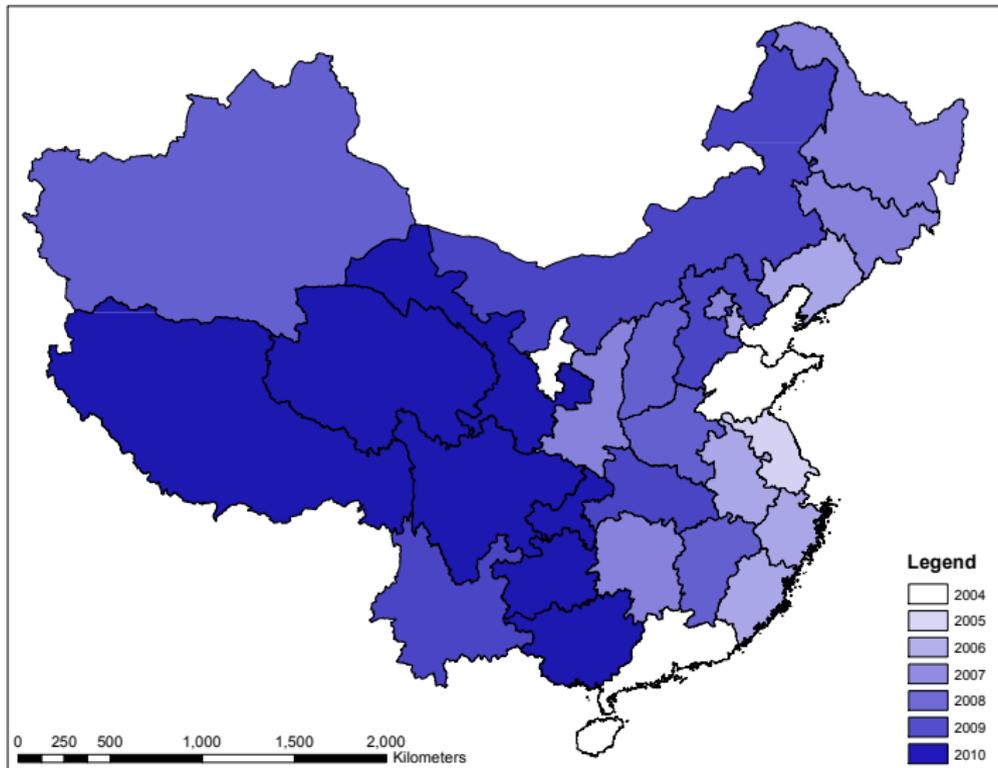

The last miles of state building:

- ▶ In early 19th century, most villages have never seen agents of the national state
- ▶ Provincial loyalties often transcended national bonds of the nation
- ▶ 1870-1914, new forces penetrated the isolated countryside
  - ▷ Judicial and school systems
  - ▷ Army
  - ▷ Catholic Church
  - ▷ Rail & roads
  - ▷ Market economy

# Cantoni et al 2017: Impact of China's 8th textbook reform

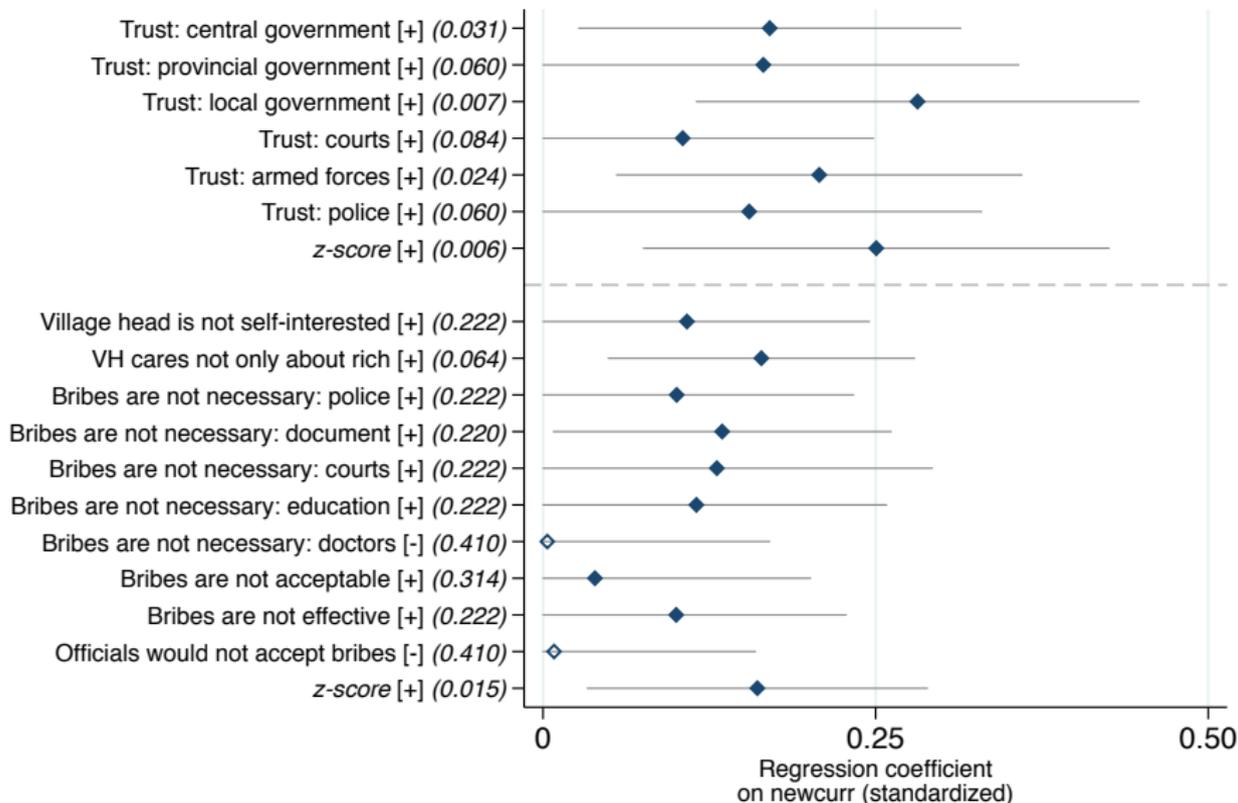

Staggered introduction of new curriculum, 2004–10

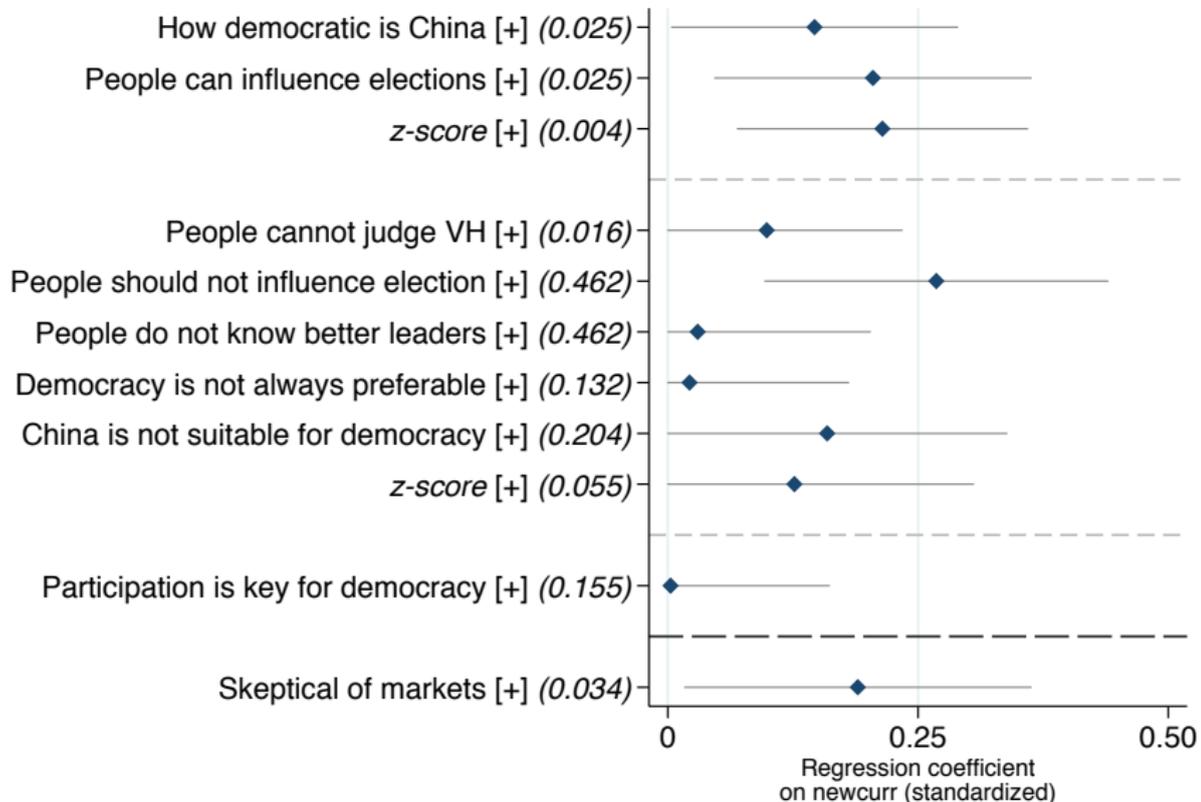

## Test for an impact of new curriculum by analyzing survey conducted with Peking University undergraduates

- ▶ It is extremely difficult to find opportunities to (let alone causally) identify government actions on ideology, preferences, identity
- ▶ Using a diff-in-diff design, Cantoni et al find significant effects of the new curriculum on students' views of:
  - ▷ Chinese *governance*; e.g., greater trust in officials
  - ▷ China's *political institutions*; e.g., viewing China as more democratic
  - ▷ *Economic institutions*; greater skepticism toward markets
- ▶ On the other hand, no significant effects on students':
  - ▷ Ethnic or national *identity*
  - ▷ Attitudes toward the *environment*
- ▶ Effects on *behavior* mixed
  - ▷ e.g. Member of Communist Party, cooperation with minorities

## e.g. Governance outcomes

## e.g. Political and economic institutions outcomes

## Some notes on surveys

- ▶ Strategies for survey design
- ▶ Strategies to reduce non-response/attrition
- ▶ Strategies to reduce experimenter demand
- ▶ Ex-post sensitivity analysis
- ▶ Design-based ways to test for biased selection or survey responses

# Social identity, norms & engineering: A political economy perspective

Nation-building

Group socialization

Behavioral modification

Social norm change

Research frontiers

# Groups use a common set of tools to socialize its members

Including use of rituals, formal education, practice

For example

- ▶ Rites of passage, initiation, hazing
- ▶ Formal education in new values, norms
- ▶ Appearance change
- ▶ Activities that promote strong in-group bonds
- ▶ Practicing new behaviors consistent with identity
- ▶ Often to the *exclusion* of material incentives

Commonly observed among

- ▶ Gangs (Maruna, S. and K. Roy 2007; Vigil, J.D. 2003)
- ▶ Armed groups (Wood, E.J. 2008; Weinstein 2007)
- ▶ Universities, fraternities
- ▶ PhD programs

## In principle, group socialization can solve principal-agent and coordination problems

- ▶ Rewarding agents for effort is expensive and difficult, especially when there is imperfect information
- ▶ Sanctioning and rewarding group members for public good contributions, collective action, or other cooperation and non-deviant behavior is also costly and tedious
- ▶ All of these cooperation challenges become much easier if there is some process by which the individual or agent internalizes the preferences of the principal or group
  - ▷ Principals could choose to invest in this technology or process, or in R&D to develop that technology
- ▶ Social animals exposed to natural and group selection would have advantages if they evolved psychological traits or cultural practices that

## Chilling example: Recruitment of child soldiers

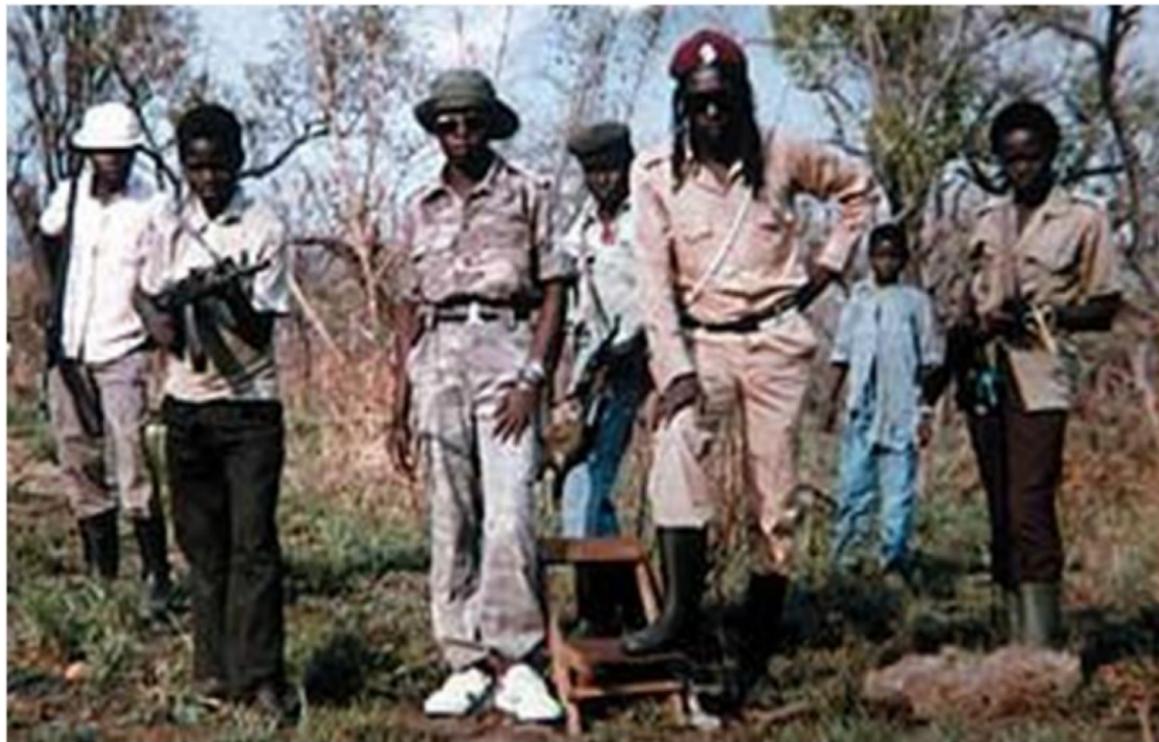

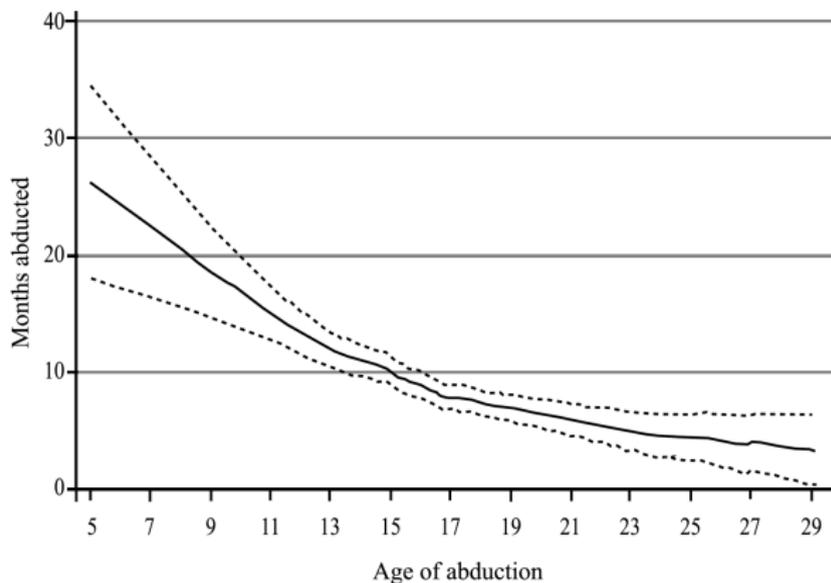

Figure: Joseph Kony and the Lord's Resistance Army in northern Uganda

## Evidence from a representative survey of (surviving) former child soldiers (Beber & Blattman 2013)

**Figure:** Forced recruitment involved violent initiations, physical and spiritual threats, spiritual and political ideological training

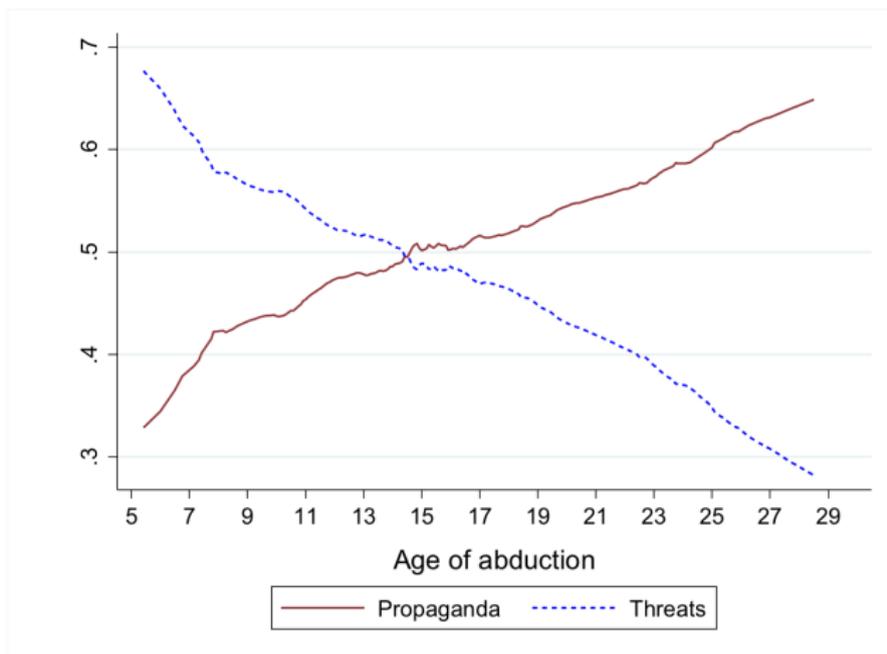

Figure: Differential application of socialization strategies.

## Underexplored territory: Military socialization

- ▶ Militaries have to solve participation and (more importantly) incentive compatibility constraints
- ▶ Few use material incentives
- ▶ There is a huge body of practice and some (internal to military) social science on this process of socialization, but little investigation by behavioral scientists or economists
  
- ▶ In addition, a body of qualitative military sociology making interesting but highly controversial claims:
  - ▷ Humans have an innate reluctance to kill
  - ▷ Most soldiers in WWII either did not fire their weapons, and when they did they did not shoot to kill (Marshall 1947)
  - ▷ This reluctance can be systematically broken down by use of standard conditioning techniques (Grossman 1996)

# Social identity, norms & engineering: A political economy perspective

Nation-building

Group socialization

**Behavioral modification**

Social norm change

Research frontiers

# Cognitive behavior therapy

One of several methodologies used for re-socialization

- ▶ A method for treating problematic thoughts and behaviors
- ▶ Huge rigorous evidence base (mainly in US), especially for depression, anxiety, phobias, anger, PTSD, and (less successfully) addiction
- ▶ Unlike talk therapy or psychotherapy, sees a “two-way street” between thoughts and behaviors:
  1. Changing people’s thinking changes behavior
    - ▶ Explicit discussion of problems and therapeutic method
    - ▶ Identify & challenge causes and consequences of harmful thoughts & behaviors
  2. But changing behaviors also changes cognitions
    - ▶ Role playing, practicing tasks
    - ▶ Expose to real situations
    - ▶ Processing experiences through discussion
    - ▶ Start easy, get more difficult

## Blattman et al 2017: CBT as non-cognitive skills development and also identity change

**Figure:** A CBT session in Monrovia with street youth – homeless, drug users, petty criminals, drug dealers, embroiled in regular everyday violence

# Can CBT shape adult self-image/identity?

- ▶ Hypotheses:
  - ▷ “Criminal outcasts” know the “regular people” norms, but those prescriptions do not apply to their social category
  - ▷ CBT a way for outcasts to practice a higher-status social category
- ▶ Key elements of the group therapy:
  - ▷ Start with appearance change, home cleanliness
  - ▷ Exposure (banks, supermarkets)
  - ▷ Success positively reinforced by family, friends
  - ▷ Process failures and setbacks with group
- ▶ A second treatment arm, cash grants, enabled another form of “practice”: starting a legitimate microenterprise

## Another possible channel: Developing self control and emotional regulation as a skill

- ▶ “Noncognitive” form of human capital
  - ▷ A strong predictor of long run economic performance, including crime (Borghans et al. 2008, Heckman et al. 2006)
  - ▷ Evolves over life cycle and is affected by upbringing, self-investment, and interventions (Heckman & Kautz 2013)
  - ▷ Thought to be malleable in childhood and, to a lesser degree, adolescence
- ▶ Could affect productivity at tasks  $\theta$
- ▶ Could affect time preferences (to the extent they are a skill not a identity-driven preference)

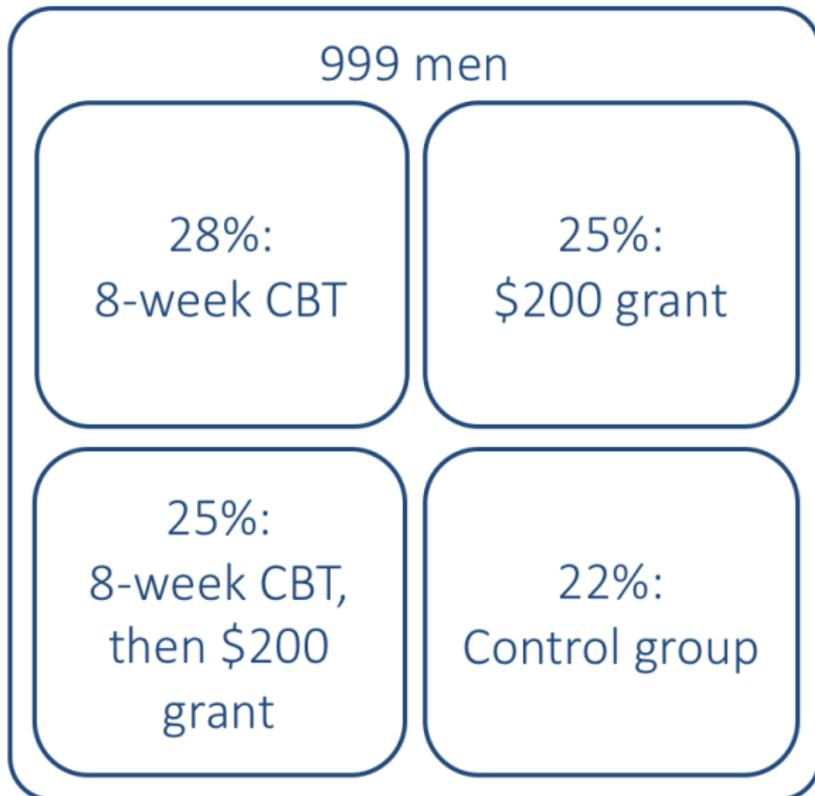

# Model of criminal occupational choice with financial market imperfections

With preferences  $\sigma$  over occupation, time preferences  $\beta$  and  $\delta$ , and productive skills or traits  $\theta$

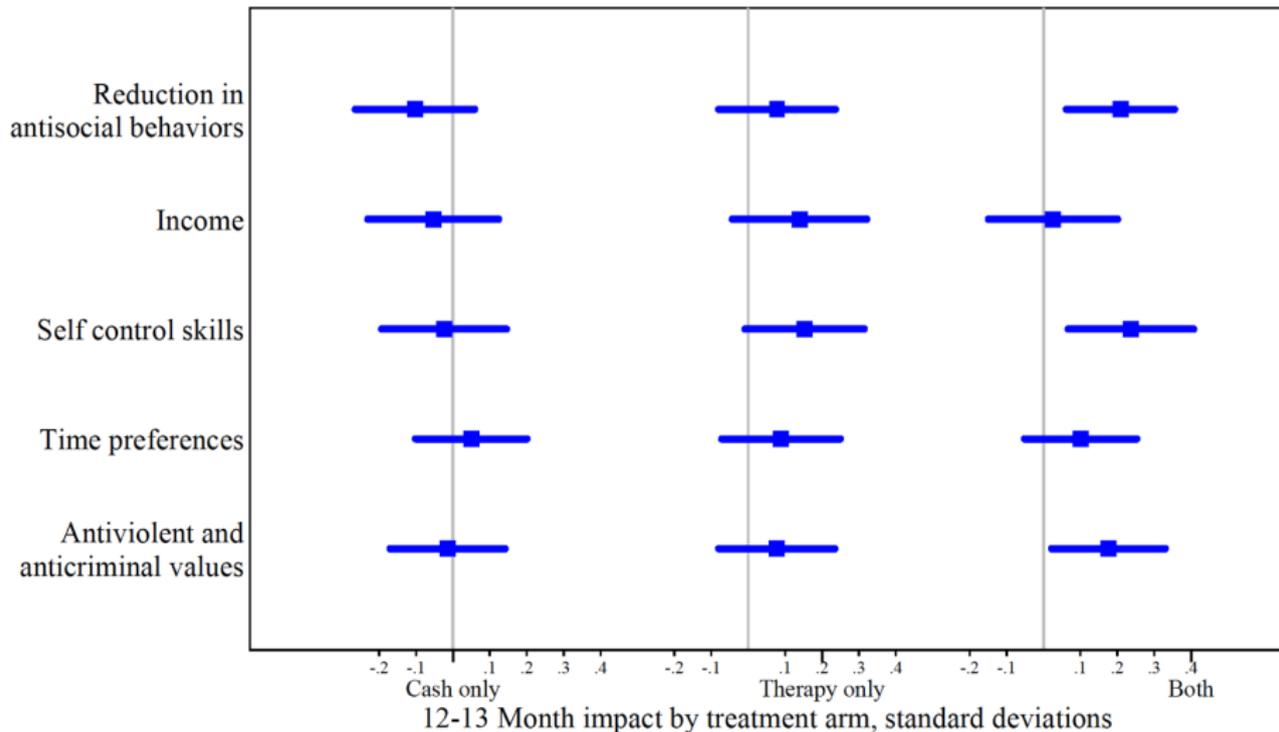

$$\begin{aligned}
 & \underset{c_t > 0, 0 \leq l_t \leq \bar{L}, L_t^b, L_t^c, K_{t+1}, a_{t+1}}{\max} && U(c_t, l_t, \sigma L_t^c) + \beta \sum_{i=1}^{\infty} \delta^i U(c_{t+i}, l_{t+i}, \sigma L_{t+i}^c) \\
 \text{s.t. } & c_t + a_{t+1} + K_{t+1} &= & F(\theta, L_t^b, K_t) + w_t L_t^c - \rho f L_{t-1}^c + (1+r)a_t \quad \text{for each } t \\
 & a_0 && \text{given}
 \end{aligned}$$

where  $L_t^b + L_t^c + l_t \equiv \bar{L}$ .

## 2 × 2 factorial design

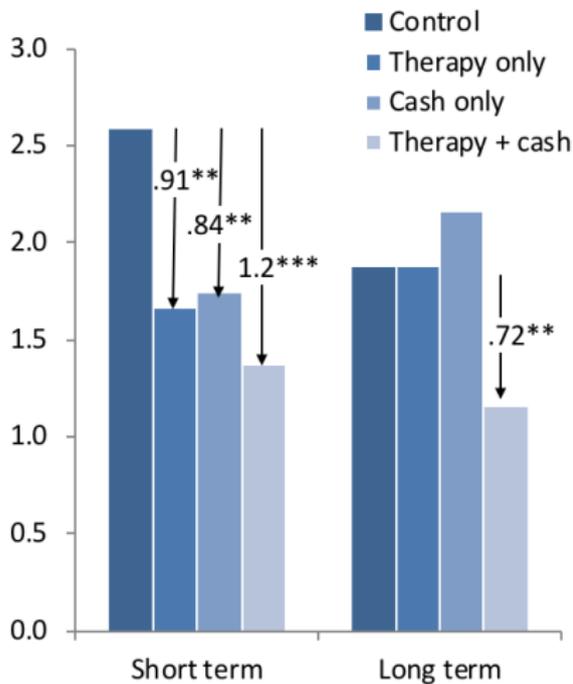

# ATEs on primary outcomes and channels

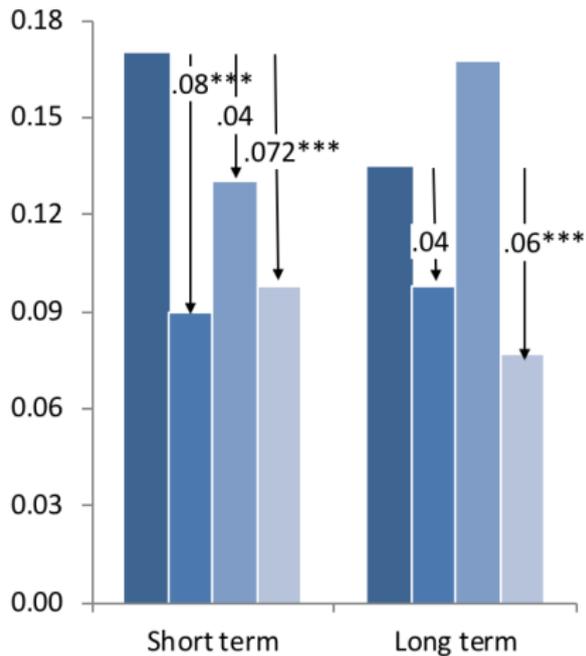

# ATEs on crime outcomes

## Thefts/robberies in past 2 weeks

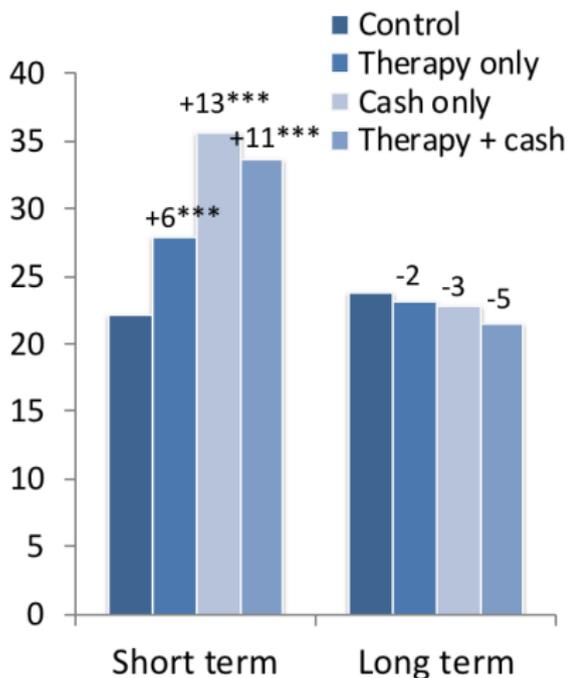

## Sold drugs in past two weeks

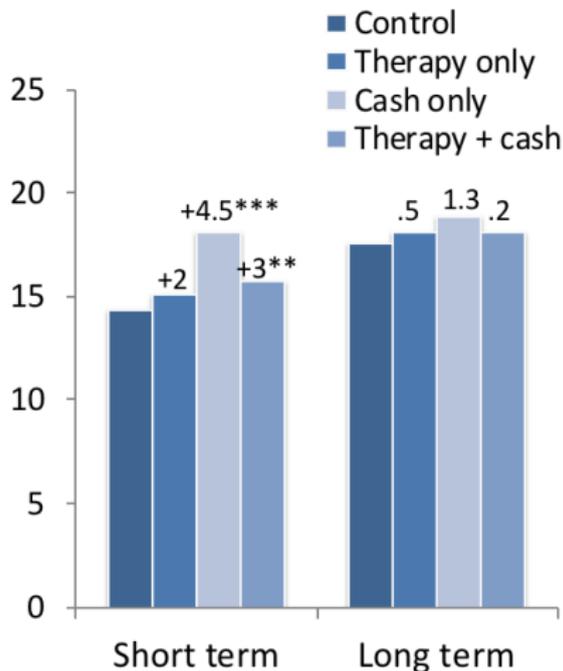

# ATEs on income

Why was identity and preference change persistent with income change was not? Cash = Extra months of "practice"?

Weekly consumption (USD)

Weekly earnings (USD)

# Social identity, norms & engineering: A political economy perspective

Nation-building

Group socialization

Behavioral modification

**Social norm change**

Research frontiers

# Social norm change as changing prescriptions $P$

- ▶ **Norms:** Informal, unwritten rules enforced by social praise and sanctions.
- ▶ **Descriptive norms:** What you believe others in group  $J$  do
- ▶ **Prescriptive norms:** What you believe others in group  $J$  believe  $J$ 's ought to do
- ▶ **Personal attitude & preferences:** Internalized social norms?
- ▶ **Culture:** A body of persistent social norms/prescriptions?
  
- ▶ Examples of norms
  - ▷ Shake hands and make eye contact
  - ▷ Stand right, walk left
  - ▷ Allow a presenter to present without interruption (or not)

Norm change takes identities, status & salience as given  
But tries to shape prescriptions, directly or through influencing actions or actions of others

$$U_j(a_j, a_{-j}, y_J, \kappa_J, I_j \mid \psi_j)$$

$$I_j(a_j, a_{-j}; c_j, \epsilon_j, P_J).$$

- ▶ **Others' observed action**  $a_{-j}$
- ▶ Group status  $y_J$
- ▶ Group salience  $\kappa_J$
- ▶ Internalized values/preferences of group  $J$ ,  $\psi_j$
- ▶ Own assignment/association with group  $c_j$
- ▶ Own characteristics  $\epsilon_j$
- ▶ **Prescriptions of group**  $P_J$
- ▶ Existence of identity group  $I$  with prescriptions  $P$

## Examples of social norm change

- ▶ Campaigns against female footbinding in China, female genital cutting in MENA/SSA, slavery in 19th century successfully change prescriptive norms associated with moral uprightness and respectability
- ▶ Trump election outcome changes descriptive social norms and willingness to express xenophobic views in public (Bursztyn et al 2017)
- ▶ New information on popularity of female workforce participation leads Saudi husbands to allow their wives to work outside the home (Bursztyn et al 2018)

# Recall Blouin & Mukand's 2017 state propaganda program

Strengthening identification with, salience of, or status of national identity?  
Changing norms of national identity? Or changing norms within ethnic identities?

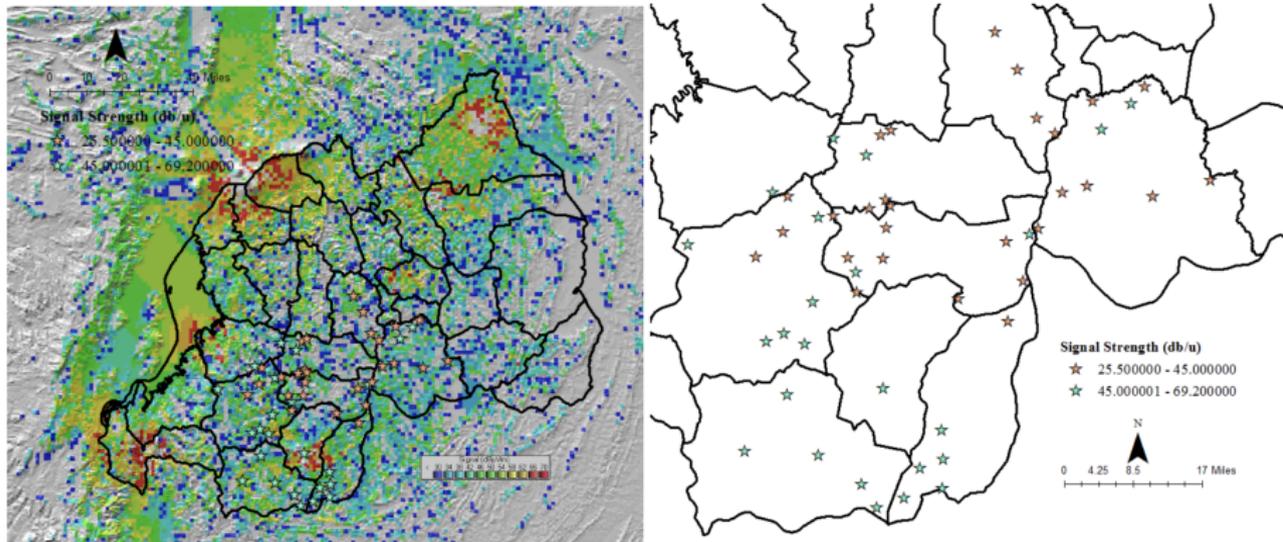

Figure 2: Radio Rwanda signal, district boundaries and subjects' village locations

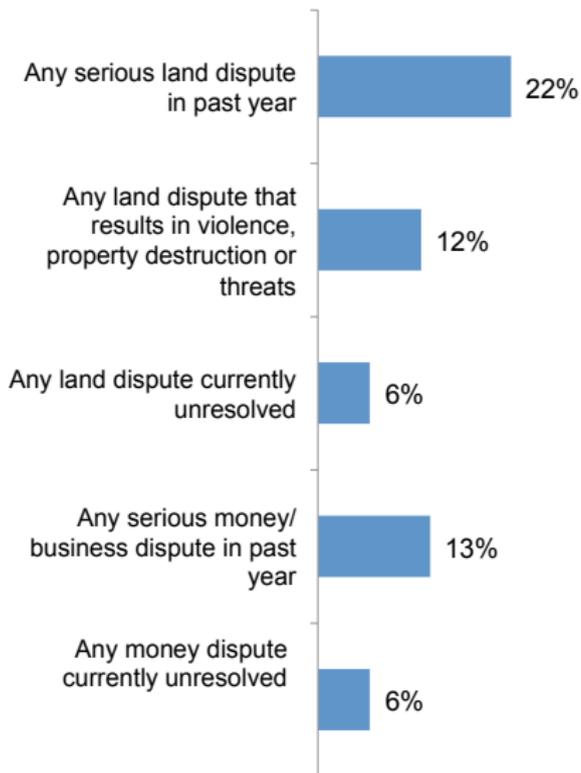

**Figure:** Use village-level variation in reception of government-owned-and-operated Radio Rwanda, which broadcasts ethnic trust/unity propaganda post-genocide

## Setting: Rural Liberian towns and villages, 2008–12

# Property disputes endemic

2010 survey of 5000 residents of 246 rural Liberian communities

# Mass education in alternative dispute resolution

Promote new skills, practices and norms to help make and sustain bargains

- ▶ Reduce asymmetric information
  - ▷ Teach communication skills (e.g. active listening, seeing from other side)
  - ▷ Inculcate norms of information sharing, discussion
  - ▷ Encourage others to mediate
- ▶ Facilitate commitment
  - ▷ Discourage defection from a forum
  - ▷ Mediators, leaders, community norms informal enforcers of agreements
- ▶ Make people more rational
  - ▷ Techniques for managing anger
  - ▷ Encourage norms of non-violence

# Program impacts after 1 and 3 years

Dependent Variable	1-year endline				3-year endline			
	Control mean	ITT	SE	ITT / control mean (%)	Control mean	ITT	SE	ITT / control mean (%)
	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
<i>Outcomes for all residents (N=4,011)</i>								
Any serious dispute	0.221	0.003	0.016	1.2	0.087	0.008	0.011	9.3

# Social identity, norms & engineering: A political economy perspective

Nation-building

Group socialization

Behavioral modification

Social norm change

Research frontiers

# Research frontiers

Wide open and so difficult to predict directions

- ▶ What is the effect of identity on motivated reasoning and information processing/avoidance?
- ▶ Nationalism and other imagined communities
  - ▷ Demonstration of purposive identity change
  - ▷ Understanding effectiveness of techniques and reasons for this
- ▶ Huge amount of behavior change research ongoing (especially CBT)
  - ▷ Little of it so far exploring mechanisms, interactions, persistence of effects
  - ▷ Little focused on identity change
- ▶ “Military sociology” and socialization into armed groups is much asserted but never convincingly demonstrated
- ▶ Have minimal groups been over-interpreted?
  - ▷ Is this a focal point that dissipates in normal contexts?
  - ▷ How powerful is parochial altruism or out-group antipathy in the “field”
  - ▷ Understanding “dehumanization” and other techniques
- ▶ What is propaganda and why does it work?
